PROPS, AND JSX

## LECTURE

WHAT IS JSX?

# WHAT IS JSX?

## JSX

- 👉 Declarative syntax to describe what components look like and how they work
- 👉 Components must **return** a block of JSX
- 👉 Extension of JavaScript that allows us to embed **JavaScript** **CSS** and React **components** into **HTML**

```
function Question(props) {  
  const question = props.question;  
  const [upvotes, setUpvotes] = useState(0);  
  
  const upvote = () => setUpvotes((v) => v + 1);  
  
  const openQuestion = () => {}; // Todo  
  
  return (  
    <div>  
      <h4 style={{ fontSize: "2.4rem" }}>  
        {question.title}  
      </h4>  
      <p>{question.text}</p>  
      <p>{question.hours} hours ago</p>  
  
      <UpvoteBtn onClick={upvote} />  
      <Answers  
        numAnswers={question.num}  
        onClick={openQuestion}>  
    </div>  
  );  
}
```

JSX returned from component

# WHAT IS JSX?

## JSX

- 👉 Declarative syntax to describe what components look like and how they work
- 👉 Components must **return** a block of JSX
- 👉 Extension of JavaScript that allows us to **embed JavaScript, CSS, and React components into HTML**
- 👉 Each JSX element is **converted** to a `React.createElement` function call
- 👉 We could use React **without JSX**

```
<header>
  <h1 style="color: red">
    Hello React!
  </h1>
</header>
```

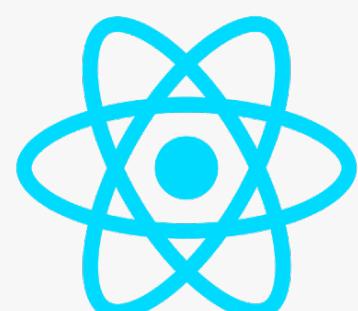

```
React.createElement(
  'header',
  null,
  React.createElement(
    'h1',
    { style: { color: 'red' } },
    'Hello React!'
)
);
```

BABEL

Hello React!

# JSX IS DECLARATIVE

IMPERATIVE

*"How to do things"*

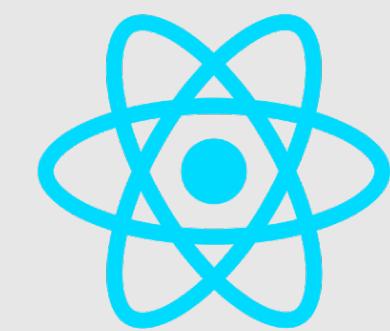

- 👉 Manual DOM element selections and DOM traversing
- 👉 Step-by-step DOM mutations until we reach the desired UI

```
const title = document.querySelector("title")
const upvoteBtn = document.querySelector("btn")
title.textContent = `[0] ${question.title}`;
let upvotes = 0;
upvoteBtn.addEventListener("click", function(){
  upvotes++;
  title.textContent =
    `[$upvotes] ${question.title}`;
  title.classList.add("upvoted");
});
```

DECLARATIVE

*"What we want"*

- 👉 Describe what UI should look like using JSX, **based on current data**
- 👉 React is an **abstraction** away from DOM: **we never touch the DOM**
- 👉 Instead, we think of the UI as a **reflection of the current data**

```
function Question(props) {
  const question = props.question;
  const [upvotes, setUpvotes] = useState(0);
  const upvote = () => setUpvotes(v => v + 1);

  return (
    <div>
      <h4>{question.title}</h4>
      <p>{question.text}</p>
      <UpvoteBtn
        onClick={upvote}
        upvotes={upvotes}
      />
    </div>
  );
}
```

## LECTURE

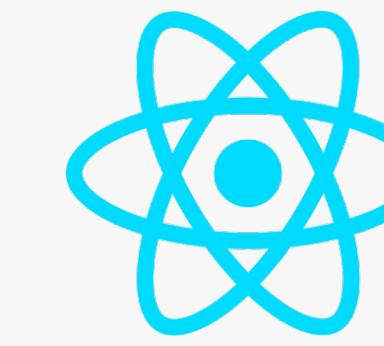

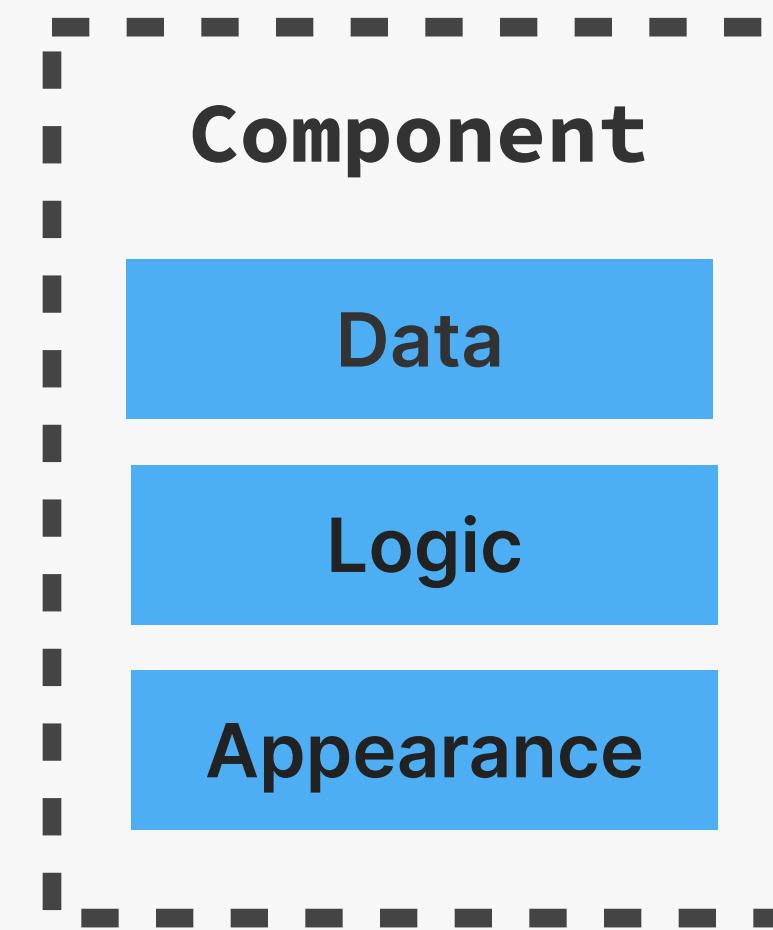

SEPARATION OF CONCERNS

# SEPARATION OF CONCERNS?

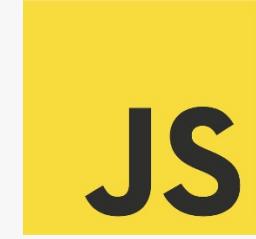

# SEPARATION OF CONCERNS?

ONE COMPONENT PER FILE

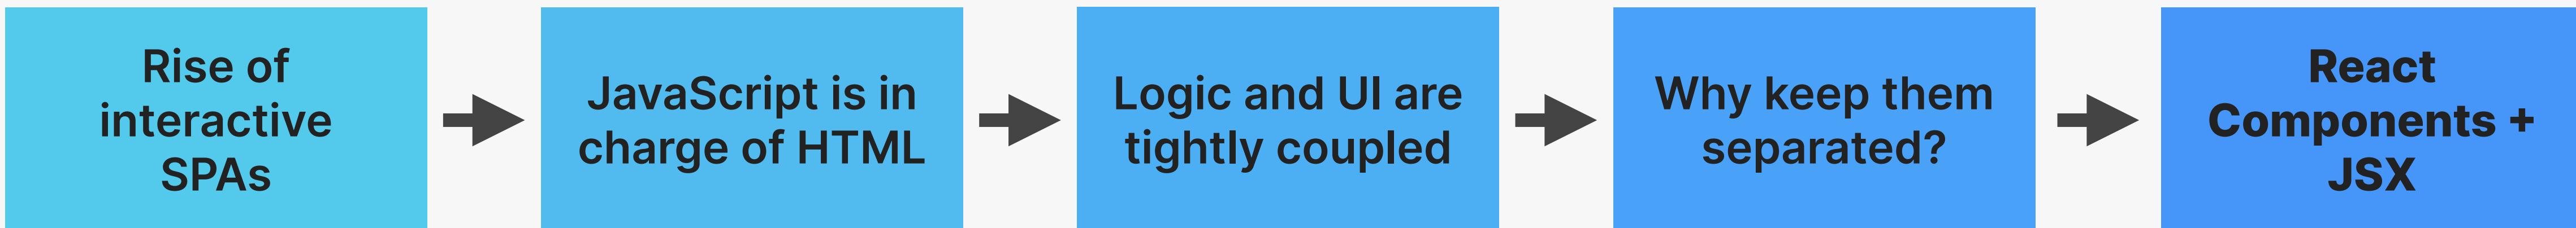

HTML and JS  
are *colocated*

```
function Question({ question }) {  
  const [upvotes, setUpvotes] = useState(0);  
  const upvote = () => setUpvotes((v) => v + 1);  
  
  return (  
    <div>  
      <h4>{question.title}</h4>  
      <UpvoteBtn onClick={upvote} />  
      {question.num > 0 ? (  
        <Answers numAnswers={question.num}></Answers>  
      ) : (  
        <FirstAnswer />  
      )}  
    </div>  
  );  
}
```

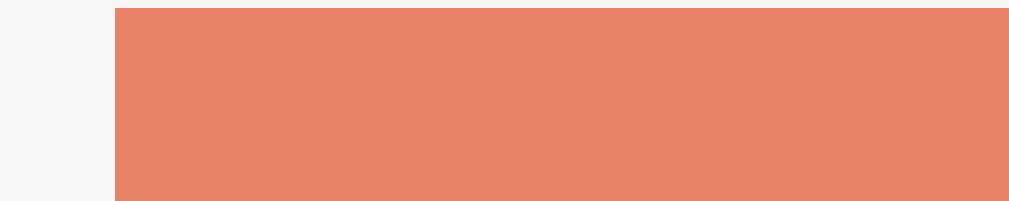

Fundamental reason for components

# SEPARATION OF CONCERNS!

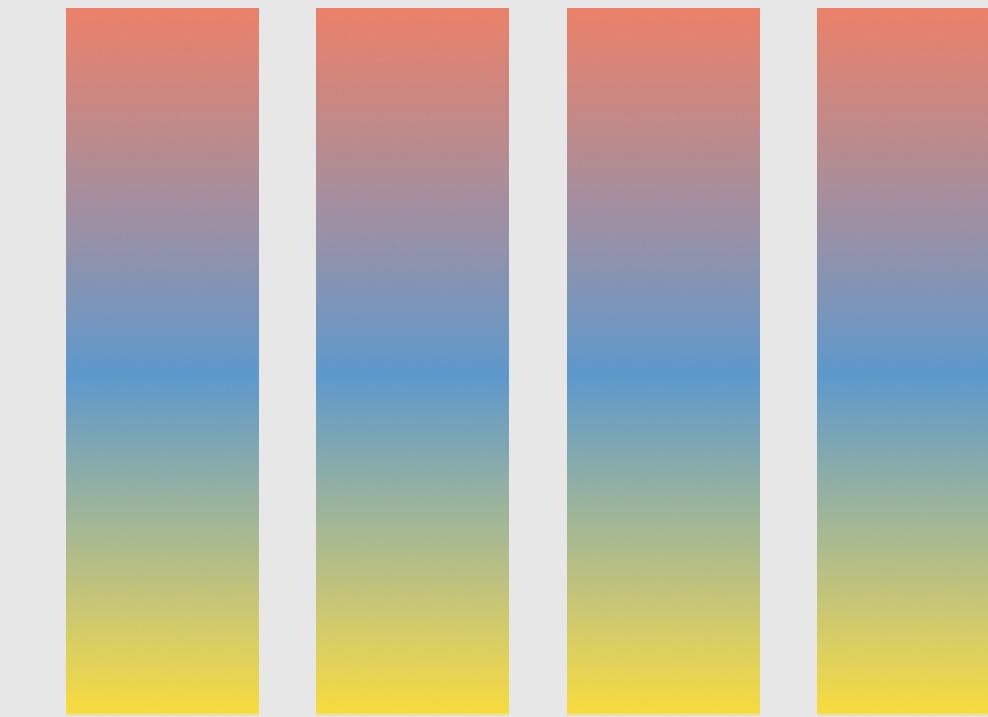

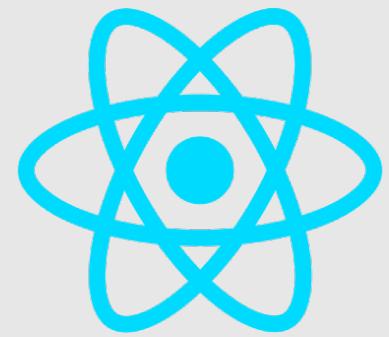

ONE TECHNOLOGY PER FILE

“Traditional”  
separation of  
concerns

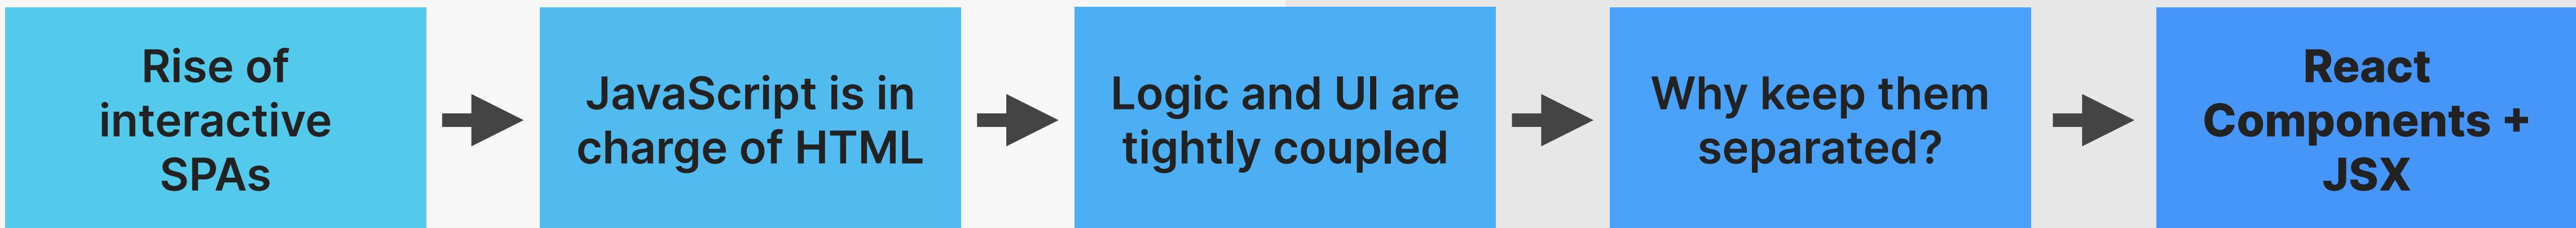

COMpletely  
NEW PARADIGM

ONE COMPONENT PER FILE

Each component  
is concerned  
with one piece  
of the UI

Question  
Menu  
Filters  
Player

WORKING WITH COMPONENTS,  
PROPS, AND JSX

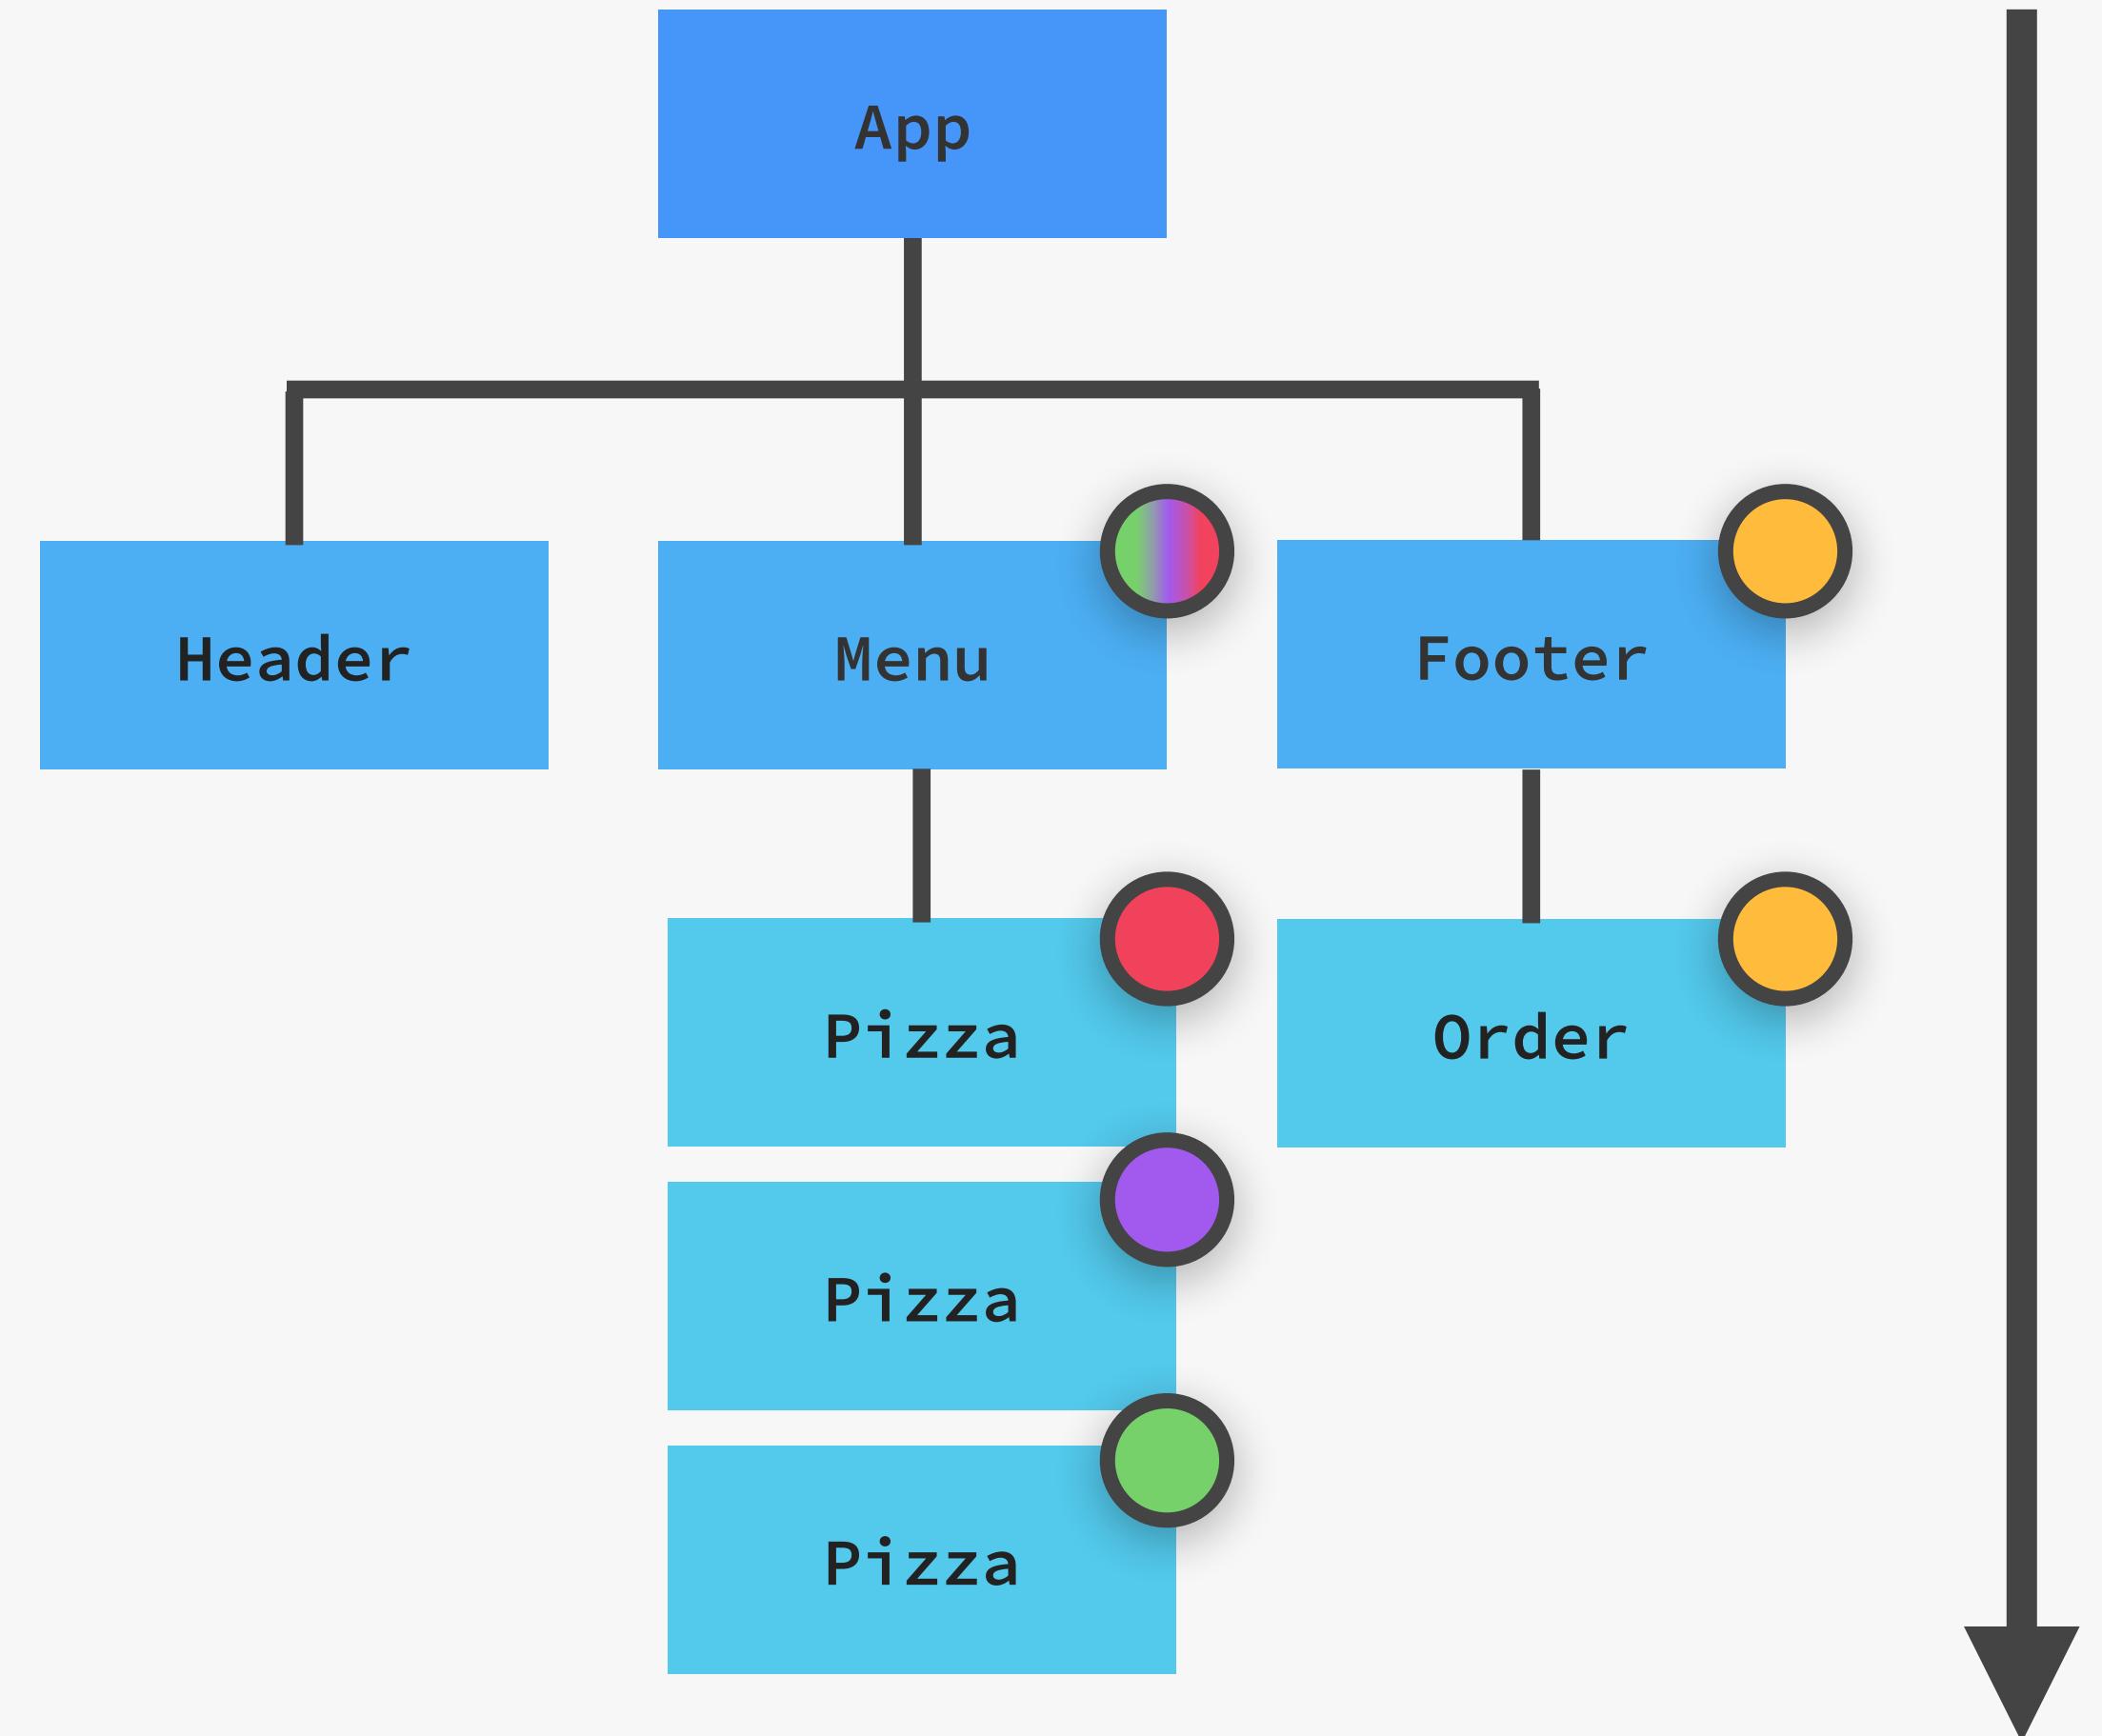

## LECTURE

PROPS, IMMUTABILITY, AND ONE-  
WAY DATA FLOW

# REVIEWING PROPS

## PROPS

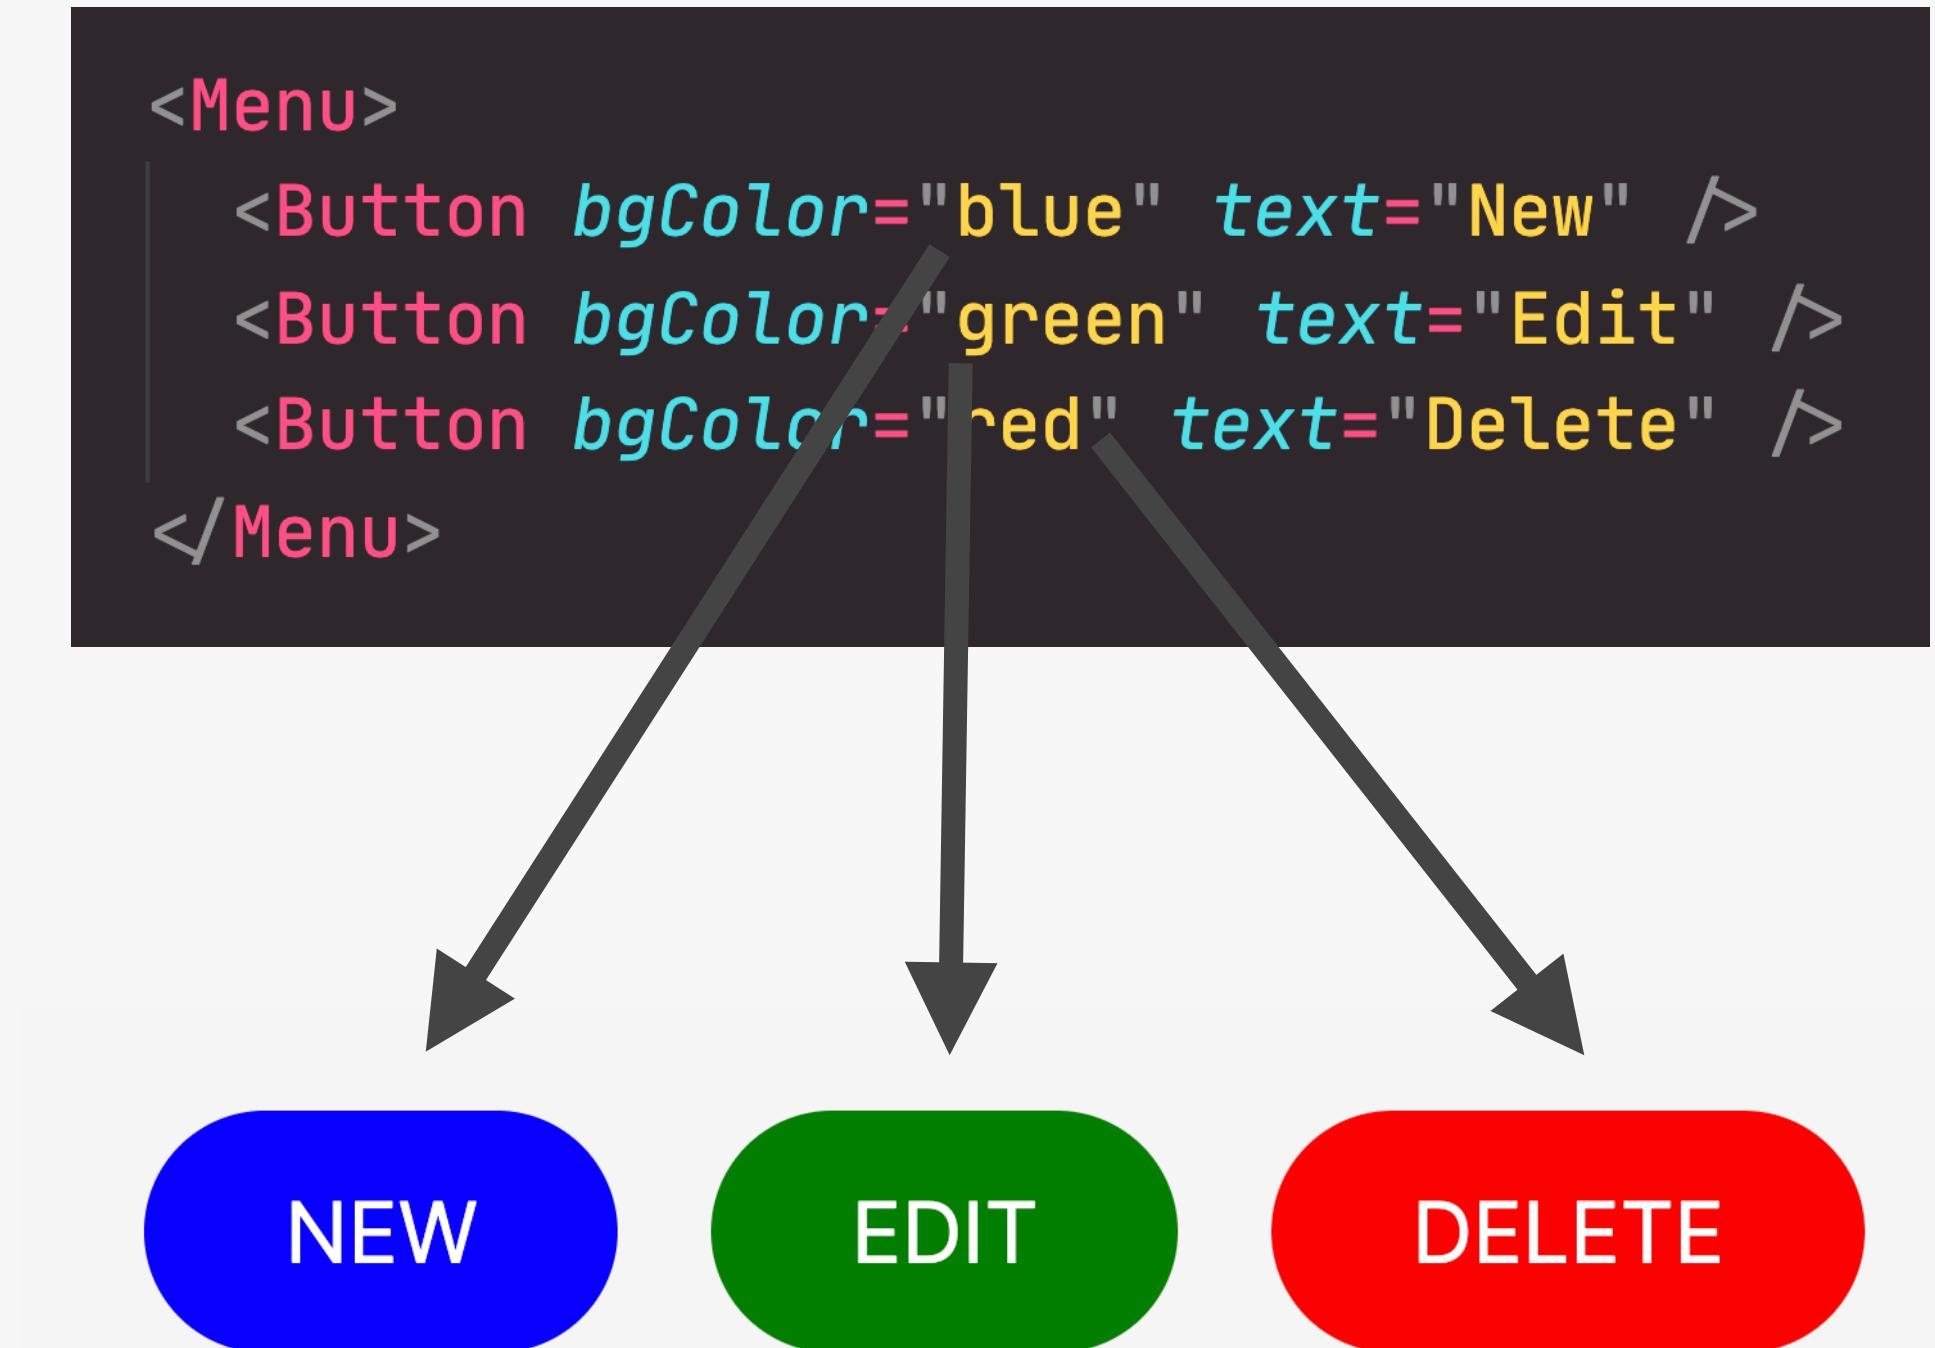

- 👉 Props are used to pass data from **parent components** to **child components** (down the component tree)

# REVIEWING PROPS

## PROPS

- 👉 Props are used to pass data from **parent components** to **child components** (down the component tree)
- 👉 Essential tool to **configure** and **customize** components (like function parameters)
- 👉 With props, parent components **control** how child components look and work

# REVIEWING PROPS

## PROPS

- 👉 Props are used to pass data from **parent components** to **child components** (down the component tree)
- 👉 Essential tool to **configure** and **customize** components (like function parameters)
- 👉 With props, parent components **control** how child components look and work
- 👉 **Anything** can be passed as props: single values, arrays, objects, functions, even other components

```
function CourseRating() {  
  const [rating, setRating] = useState(0);  
  
  return (  
    <Rating  
      text="Course rating"  
      currentRating={rating}  
      numOptions={3}  
      options={['Terrible', 'Okay', 'Amazing']}  
      allRatings={{ num: 2390, avg: 4.8 }}  
      setRating={setRating}  
      component={Star}  
    />  
  );  
  
  function Star() {  
    // To do  
  }  
}
```

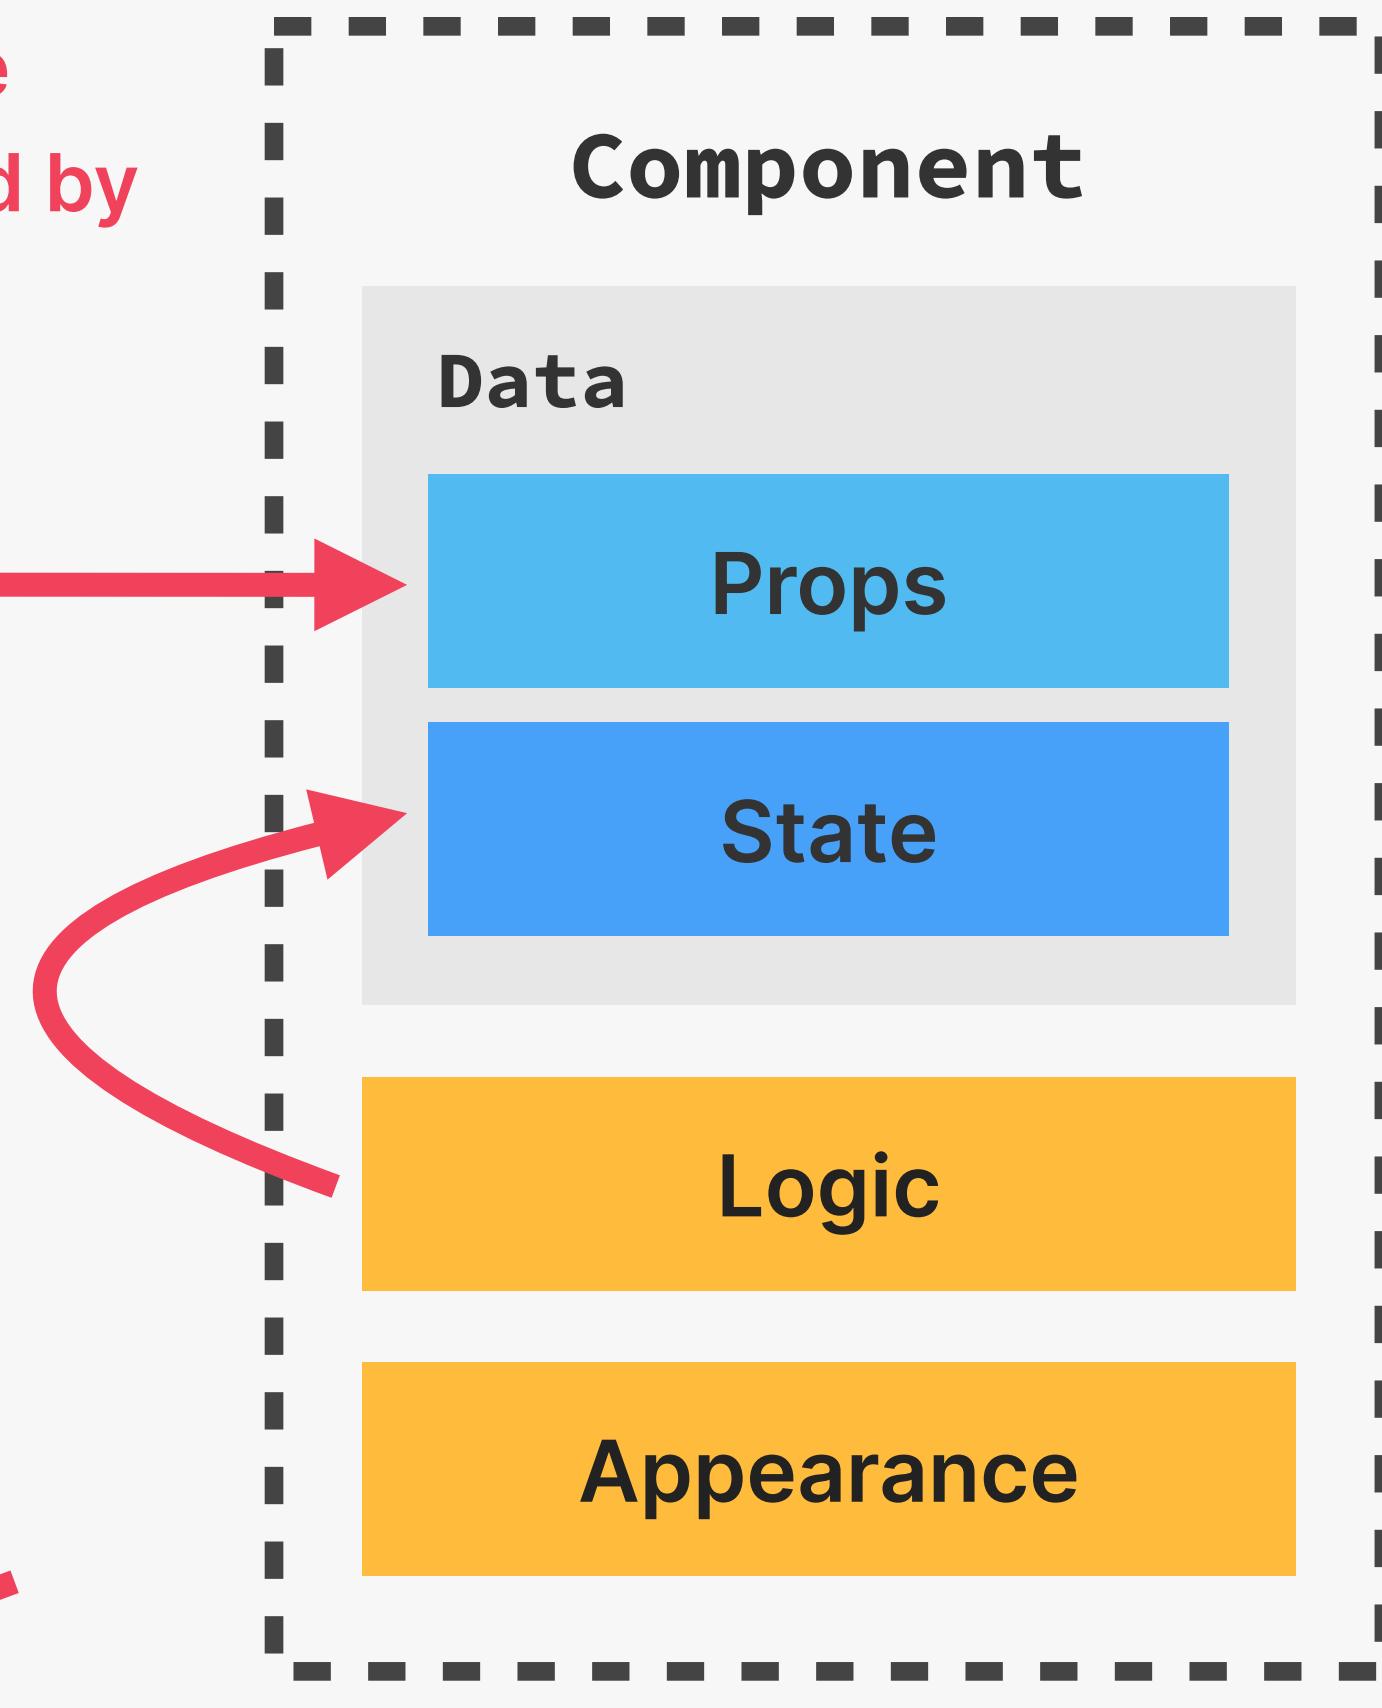

# PROPS ARE READ-ONLY!

Props is data coming from the **outside**, and can **only** be updated by the **parent component**

Parent Component

State is **internal data** that can be updated by the **component's logic**

```
let x = 7;  
  
function Component() {  
  x = 23;  
  return <h1>Number {x}</h1>  
}
```

Don't do this!

👉 Props are **read-only**, they are **immutable**! This is one of React's strict rules.

👉 If you need to mutate props, you actually **need state**

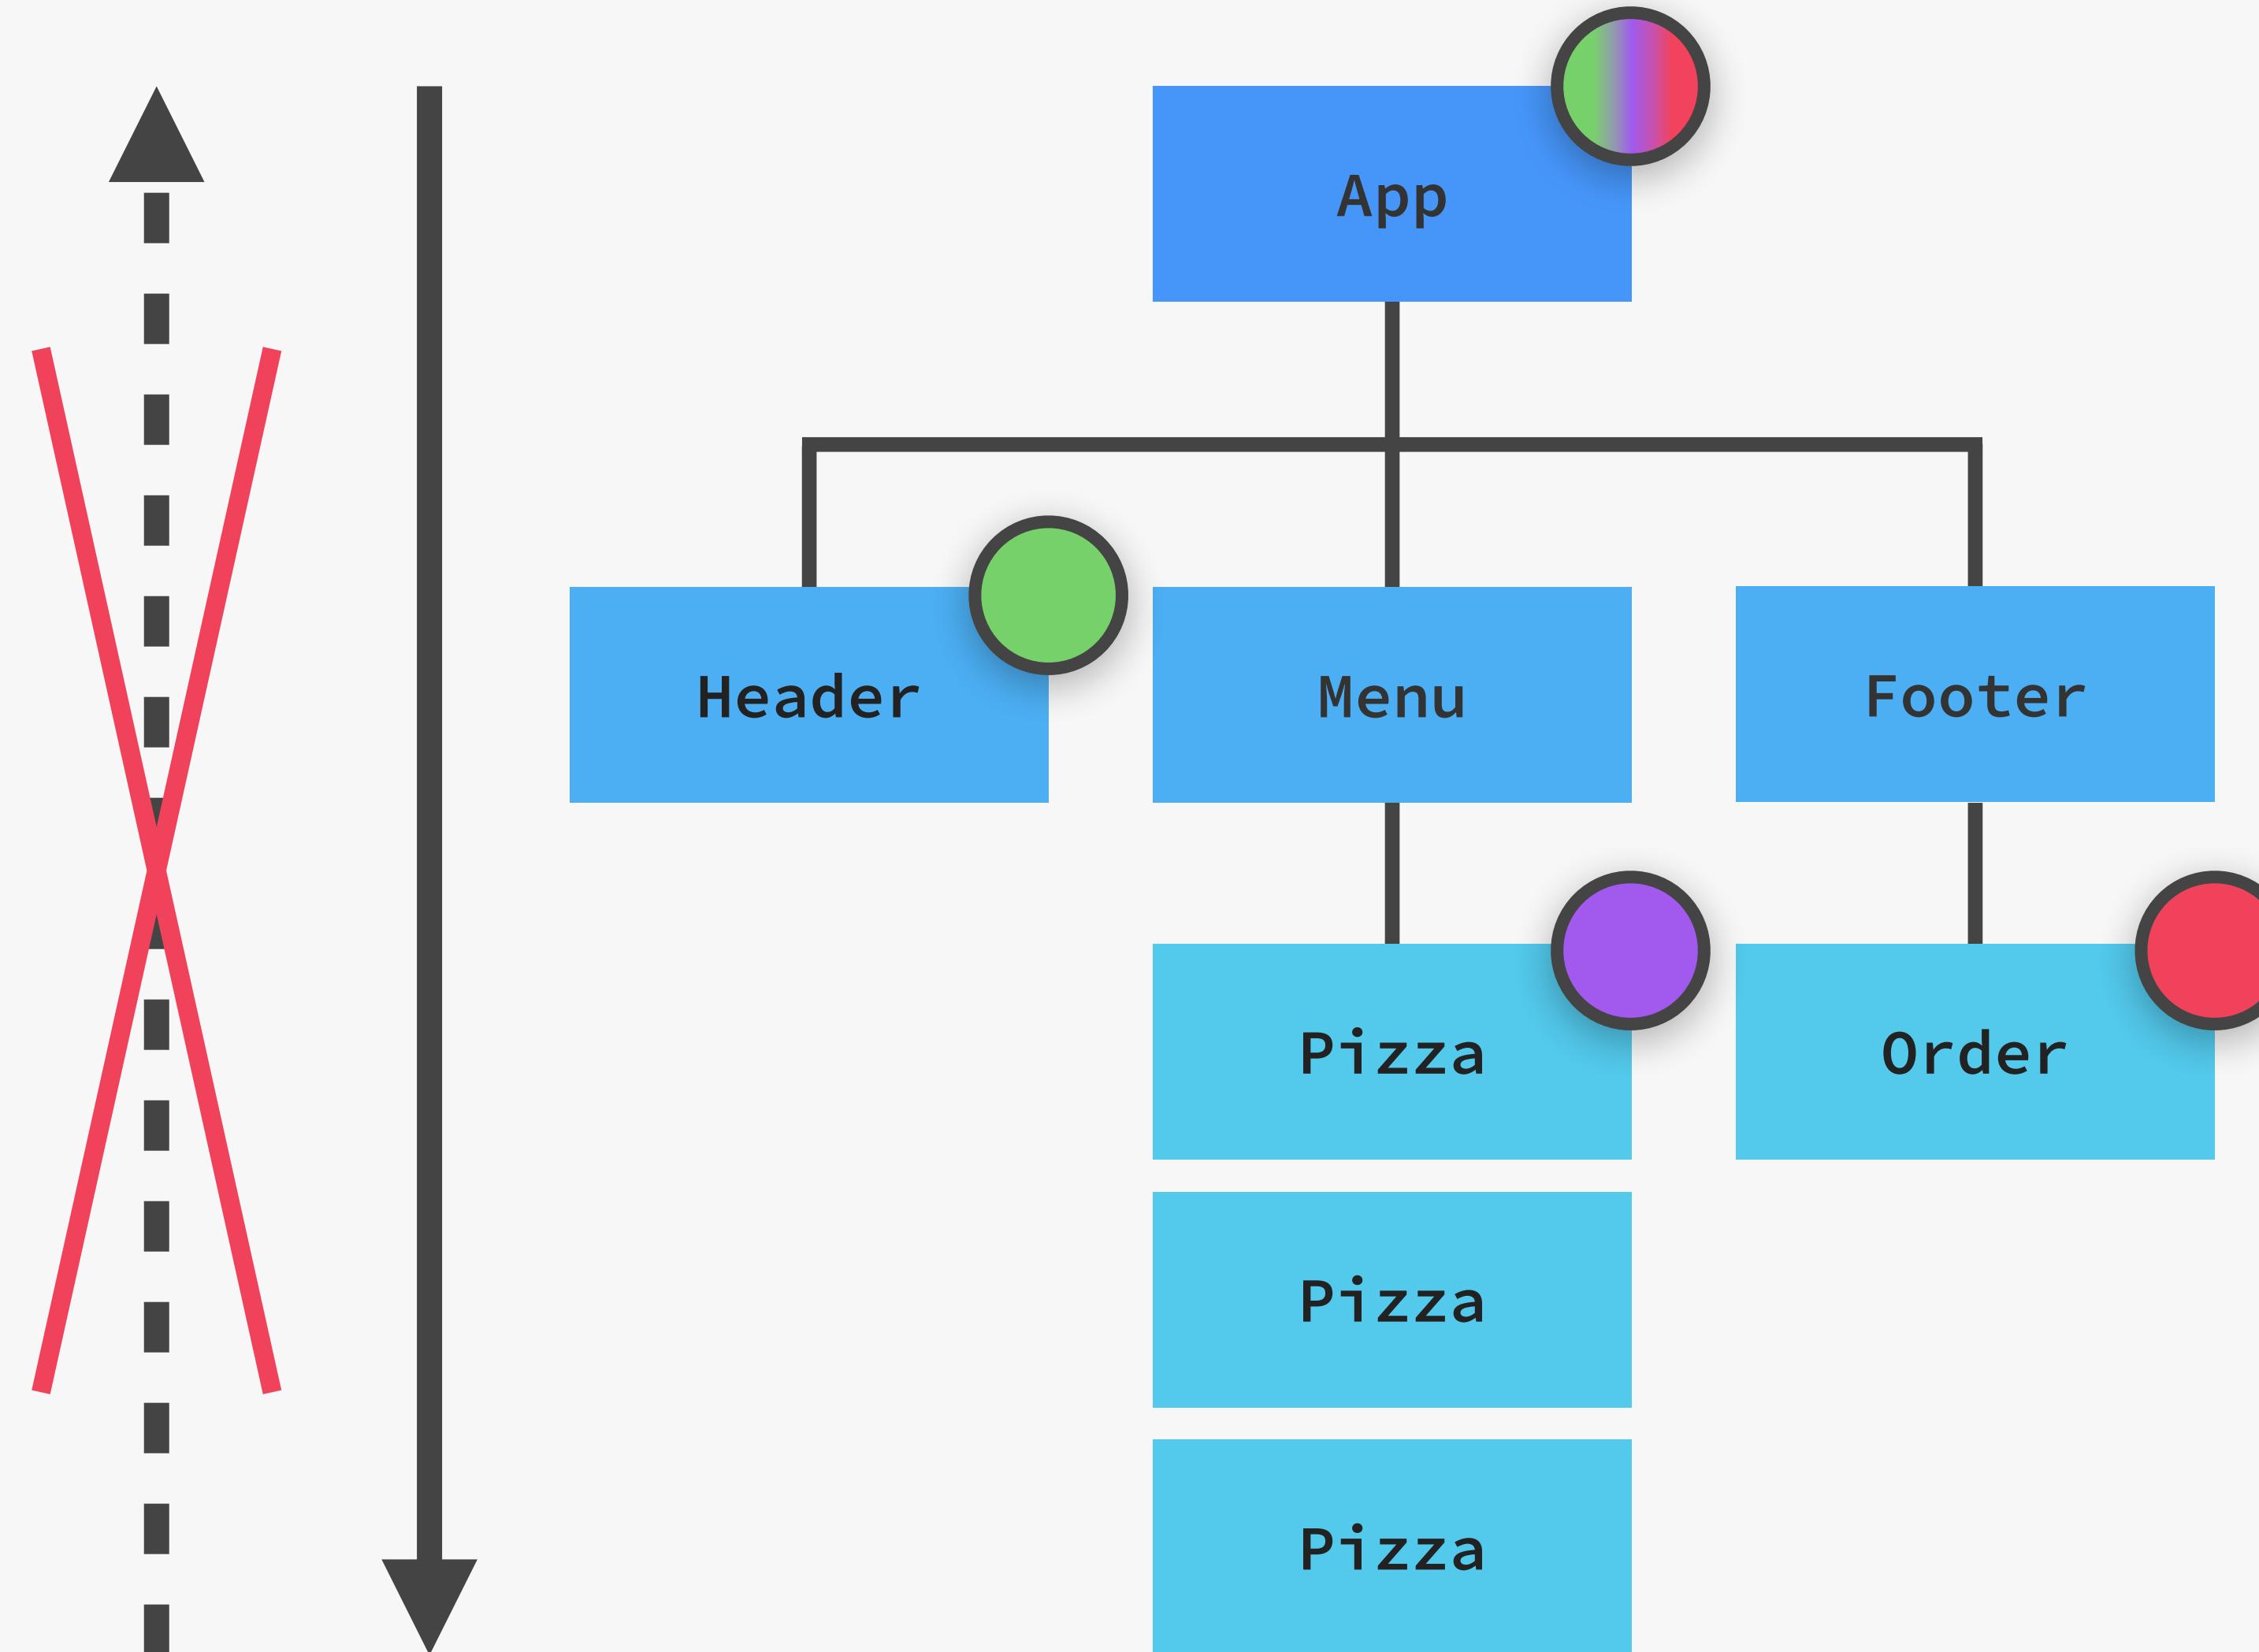

↓ WHY?

👉 Mutating props would affect parent, creating **side effects** (not pure)

👉 Components have to be **pure functions** in terms of props and state

👉 This allows React to optimize apps, avoid bugs, make apps predictable

# ONE-WAY DATA FLOW

## ONE-WAY DATA FLOW...

- 👍 ... makes applications more predictable and easier to understand
- 👍 ... makes applications easier to debug, as we have more control over the data
- 👍 ... is more performant

*Angular has two-way data flow*

## LECTURE

THE RULES OF JSX

# RULES OF JSX

## GENERAL JSX RULES

- 👉 JSX works essentially like HTML, but we can enter “**JavaScript mode**” by using {} (for text or attributes)
  - 👉 We can place **JavaScript expressions** inside {}.  
Examples: reference variables, create arrays or objects, [] .map(), ternary operator
  - 👉 Statements are **not allowed** (if/else, for, switch)
  - 👉 JSX produces a **JavaScript expression**
- ==  `const el = <h1>Hello React!</h1>;`  
`const el = React.createElement("h1", null, "Hello React!");`
- 1 We can place **other pieces of JSX** inside {}
  - 2 We can write JSX **anywhere** inside a component (in if/else, assign to variables, pass it into functions)
  - 👉 A piece of JSX can only have **one root element**. If you need more, use <React.Fragment> (or the short <>)

## DIFFERENCES BETWEEN JSX AND HTML

- 👉 `className` instead of HTML's `class`
- 👉 `htmlFor` instead of HTML's `for`
- 👉 Every tag needs to be **closed**. Examples: `<img />` or `<br />`
- 👉 All event handlers and other properties need to be **camelCased**. Examples: `onClick` or `onMouseOver`
- 👉 **Exception:** `aria-*` and `data-*` are written with dashes like in HTML
- 👉 CSS inline styles are written like this: `{}{{<style>}}` (to reference a variable, and then an object)
- 👉 CSS property names are also **camelCased**
- 👉 Comments need to be in {} (because they are JS)

SECTION SUMMARY

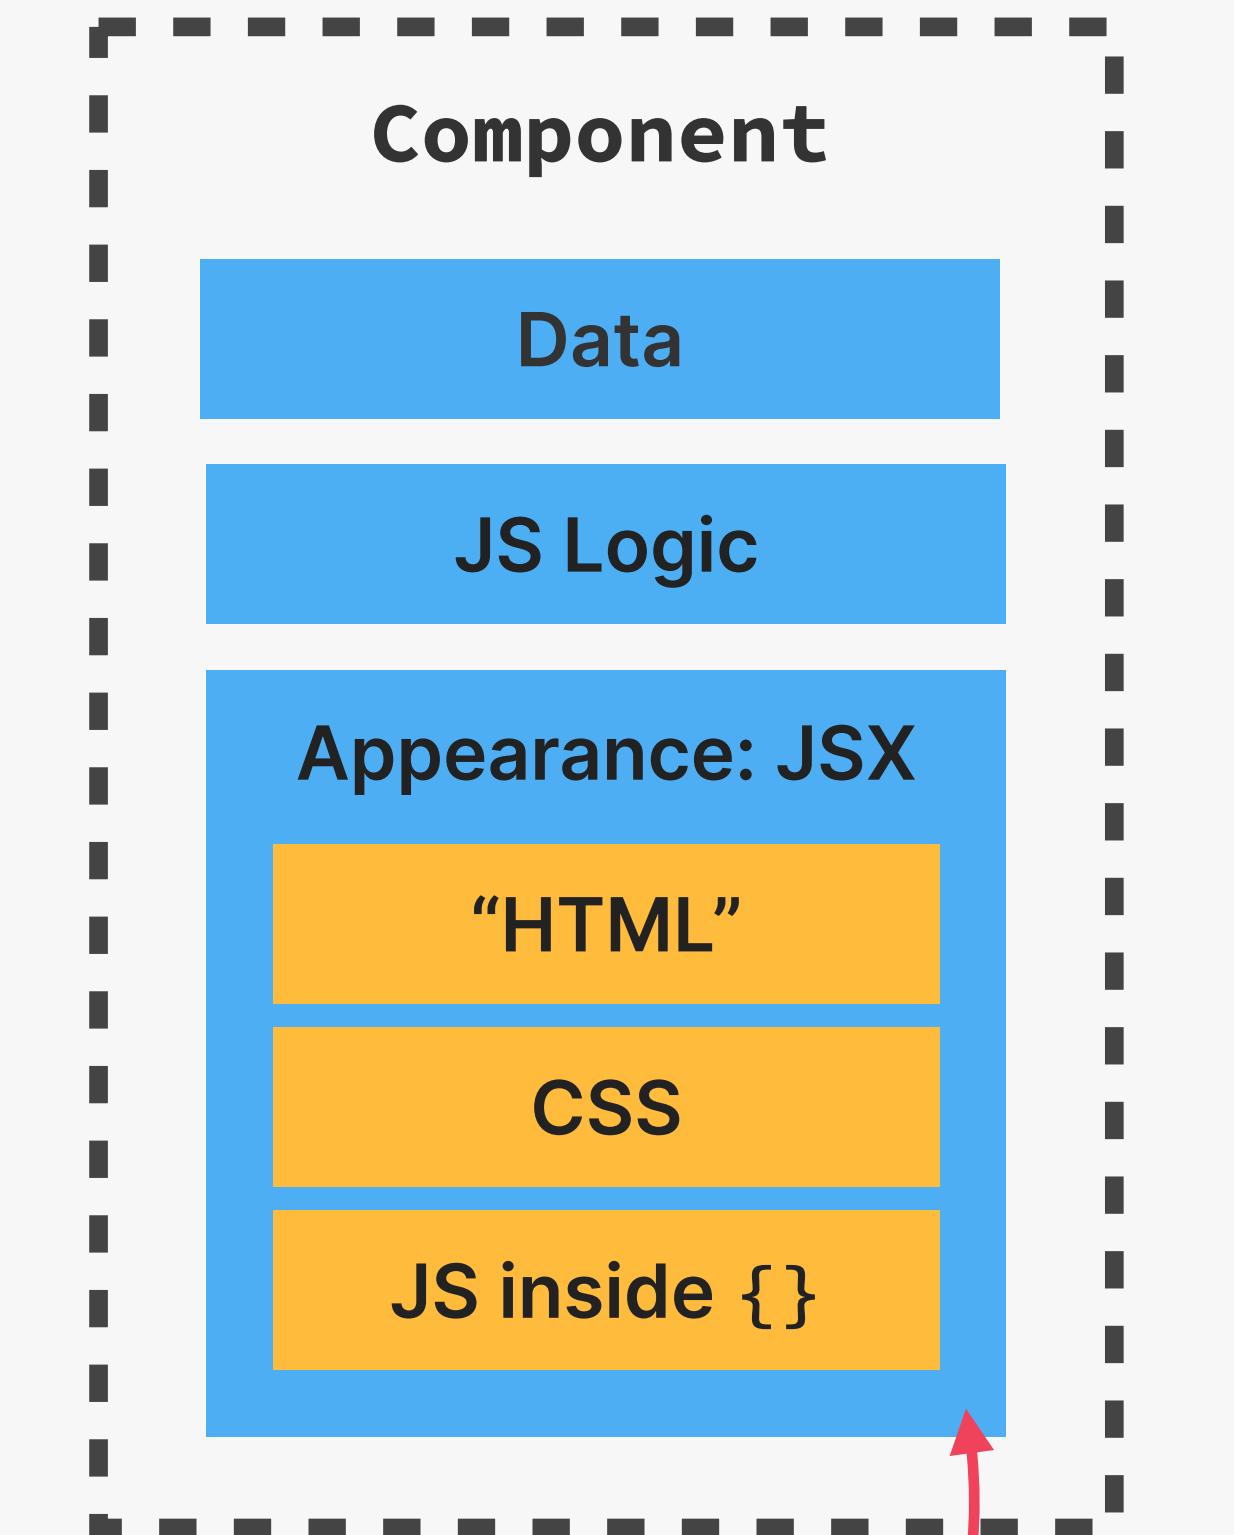

# SECTION SUMMARY

To pass data from parent to child components

Components in component tree

Components can be conditionally rendered using JS tools: &&, ?, and multiple return

JSX block is what we return from a component
